

AXIS and the Real Game Changer: AI is changing digital trust

The end of old benchmarks — Fakes are now becoming almost indistinguishable: cloned voices, generated documents, reproduced identities, manipulated communications. The old model based on implicit signals of credibility is gradually entering a crisis.

The crisis is becoming systemic — When verification mechanisms become fragile, it is no longer just the platforms that are affected. Compliance costs increase, control procedures multiply, and digital systems become vulnerable to automated manipulation.

Towards Trusted Infrastructures — A new generation of infrastructures now seeks to make trust programmable, verifiable, and executable through digital identity, programmable governance, and sovereign architecture.

AXIS as an illustration of the shift — The national AXIS program precisely illustrates this transformation: governing flows, securing interactions, and building systems capable of linking finance, identity, and digital sovereignty in the 21st-century economy.

Trust is becoming the new global critical infrastructure
