

Who actually produces intelligibility in digital finance ecosystems?

A multitude of actors — Developers, operators, investors, public institutions, local communities, and the media participate simultaneously in digital finance ecosystems. None of them alone possesses a complete view of the system.

The chains of intelligibility — For the network to function, these universes must remain connected. Ongoing translation operations link the representations produced by each of the actors involved.

A plurality of languages — Each category of actors mobilizes its own references. Technical, financial, regulatory, political or citizen language often describes the same realities from different perspectives.

A collective asset — Shared understanding then becomes a strategic resource. It fosters trust, facilitates coordination, and conditions the adoption of innovations by the various participants in the network.

It is intelligibility that creates trust
