

Prologue: A trilogy for reflecting on digital trust

A conviction — Digital transformation is not just a question of technology. It invites us to rethink the foundations of trust between States, financial institutions, businesses and citizens.

A method — Each article represents a step in a single line of reasoning: producing evidence, structuring responsibilities, governing transactions, and reinforcing trust.

A demonstration — This trilogy shows how document traceability evolves into a genuine chain of trust, and subsequently into a digital sovereignty infrastructure.

An ambition — To offer a trusted architecture capable of supporting asset tokenization, digital finance, and new public infrastructures.

Trust is becoming an infrastructure.
