

From the chain of trust to digital sovereignty

Infrastructure — A chain of trust can become national infrastructure serving government agencies, regulators, and financial institutions.

Sovereignty — States thus have a framework enabling them to reconcile innovation, compliance, transparency, and control over their strategic resources.

Finance — Tokenization and digital finance realize their full value when underpinned by documented and verifiable governance.

The vision — Trust becomes a collective asset, serving economic development, financial inclusion, and international cooperation.

Trust: a new infrastructure for sovereignty
